Kinney_DSC550_Titanic_Part_2

January 22, 2020

0.1 D. Kinney DSC 550 Titanic Tutorial Part 2:

Graphics Analysis (*below*)
Feature Reduction (Extraction/Selection)
Filling in Missing Values

Step 11 - fill in missing values and eliminate features

[17]:
```
#fill the missing age data with median value
def fill_na_median(data, inplace=True):
    return data.fillna(data.median(), inplace=inplace)

fill_na_median(data['Age'])

# check the result
print(data['Age'].describe())
```

```
count    891.000000
mean      29.361582
std       13.019697
min        0.420000
25%       22.000000
50%       28.000000
75%       35.000000
max       80.000000
Name: Age, dtype: float64
```

[18]:
```
# fill with the most represented value
def fill_na_most(data, inplace=True):
    return data.fillna('S', inplace=inplace)

fill_na_most(data['Embarked'])

# check the result
print(data['Embarked'].describe())
```

```
count     891
unique      3
```

```
top          S
freq       646
Name: Embarked, dtype: object
```

[19]:
```
# import package
import numpy as np

# log-transformation
def log_transformation(data):
    return data.apply(np.log1p)

data['Fare_log1p'] = log_transformation(data['Fare'])

# check the data
print(data.describe())
```

```
       PassengerId    Survived      Pclass         Age       SibSp  \
count   891.000000  891.000000  891.000000  891.000000  891.000000
mean    446.000000    0.383838    2.308642   29.361582    0.523008
std     257.353842    0.486592    0.836071   13.019697    1.102743
min       1.000000    0.000000    1.000000    0.420000    0.000000

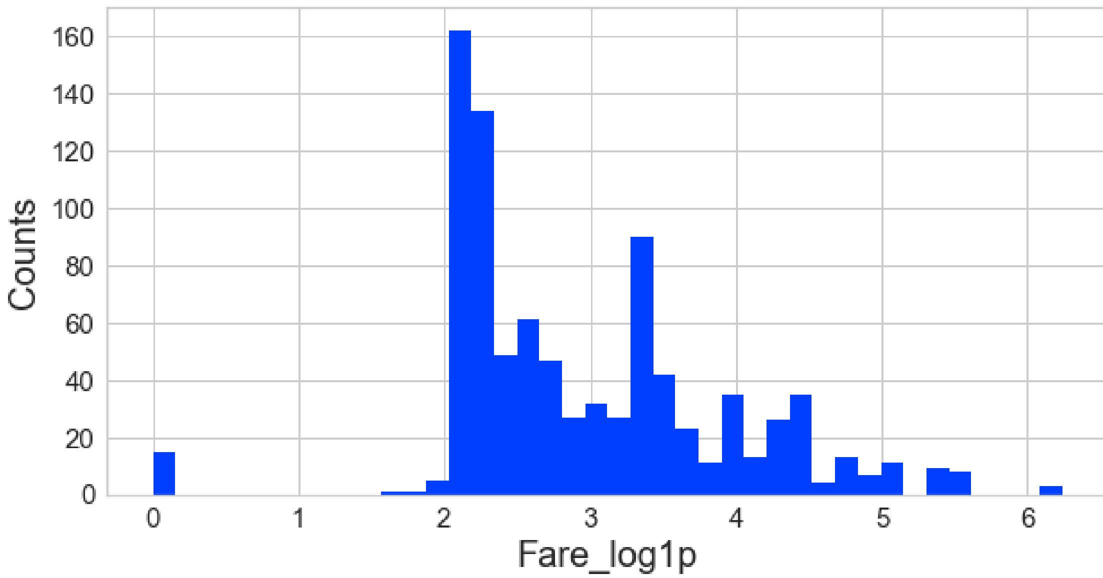
max      6.000000  512.329200    6.240917
```

Step 12 - adjust skewed data (fare)

[20]:
```
#check the distribution using histogram

# set up the figure size
plt.rcParams['figure.figsize'] = (10, 5)

plt.hist(data['Fare_log1p'], bins=40)
plt.xlabel('Fare_log1p', fontsize=20)
plt.ylabel('Counts', fontsize=20)
plt.tick_params(axis='both', labelsize=15)
```



Step 13 - convert categorical data to numbers

[21]:
```python
#get the categorical data
cat_features = ['Pclass', 'Sex', "Embarked"]
data_cat = data[cat_features]
data_cat = data_cat.replace({'Pclass': {1: '1st', 2: '2nd', 3: '3rd'}})

# One Hot Encoding
data_cat_dummies = pd.get_dummies(data_cat)

# check the data
print(data_cat_dummies.head(8))
```

```
   Pclass_1st  Pclass_2nd  Pclass_3rd  Sex_female  Sex_male  Embarked_C  \
0           0           0           1           0         1           0
1           1           0           0           1         0           1
2           0           0           1           1         0           0
3           1           0           0           1         0           0
4           0           0           1           0         1           0
5           0           0           1           0         1           0
6           1           0           0           0         1           0
7           0           0           1           0         1           0

3           0           1
```

```
4              0              1
5              1              0
6              0              1
7              0              1
```

0.2 Titanic Tutorial Part 1:

0.2.1 Graph Analysis

---

[1]:
```python
import warnings
warnings.filterwarnings("ignore")
```

[2]:
```python
import pandas as pd
import matplotlib.pyplot as plt
import yellowbrick
from yellowbrick.features import Rank2D
from yellowbrick.features import ParallelCoordinates
from yellowbrick.style import set_palette

%matplotlib inline
```

Step 1: Load data into dataframe

[3]:
```python
addr1 = "data/train.csv"
data = pd.read_csv(addr1)
```

Step 2: check the dimension of the table

[4]:
```python
print("The dimension of the table is: ", data.shape)
```

```
The dimension of the table is:  (891, 12)
```

Step 3: Look at the data

[5]:
```python
print(data.head(5))
```

```
   PassengerId  Survived  Pclass  \
0            1         0       3
1            2         1       1
2            3         1       3
3            4         1       1
4            5         0       3

                                                Name     Sex   Age  SibSp  \
0                            Braund, Mr. Owen Harris    male  22.0      1
```

```

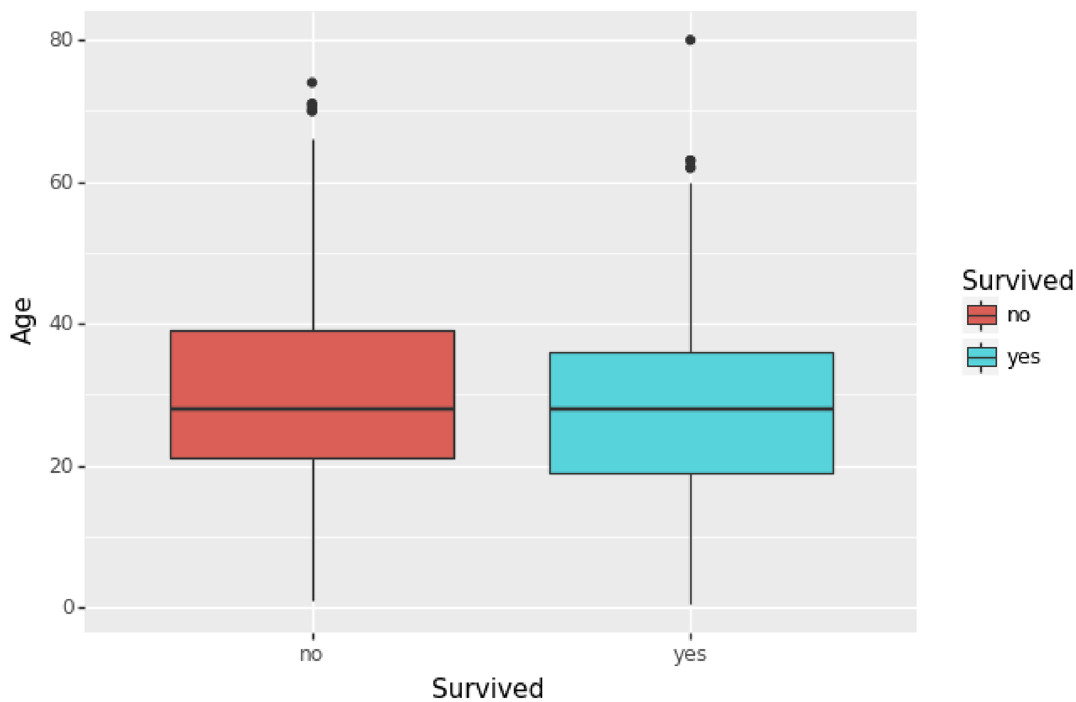
specified.
```

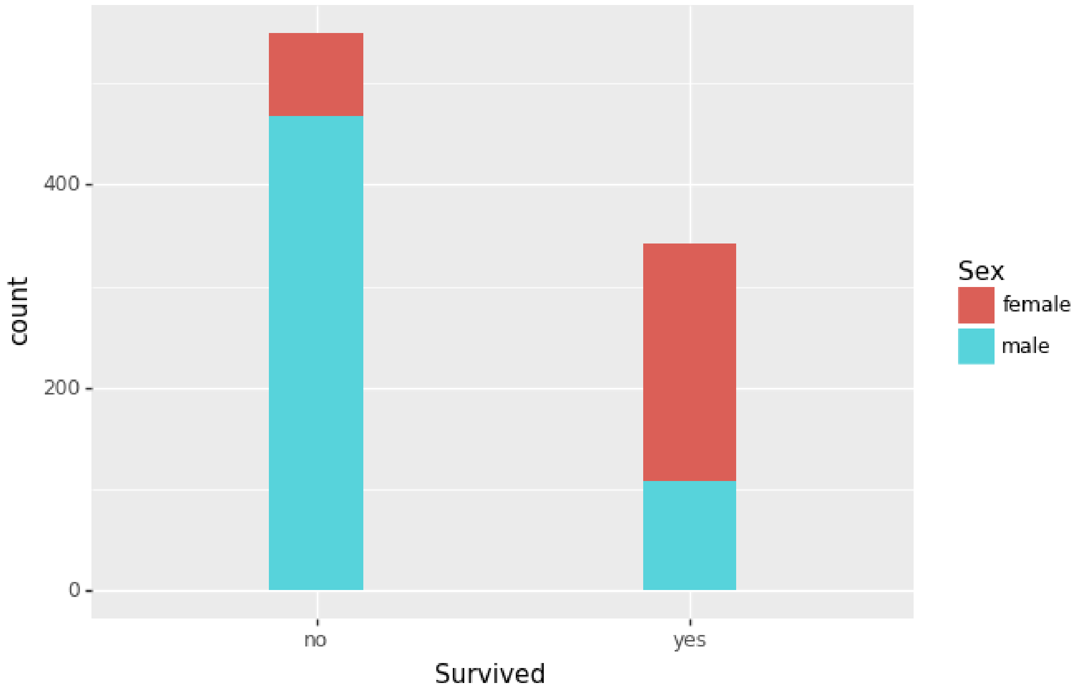
[8]:

```python
from plotnine import *
df = data.copy()
df = df.replace({'Survived': {1: 'yes', 0: 'no'}})
(ggplot(df, aes(x='Survived', y='Age', fill='Survived')) +
        geom_boxplot()
)
```



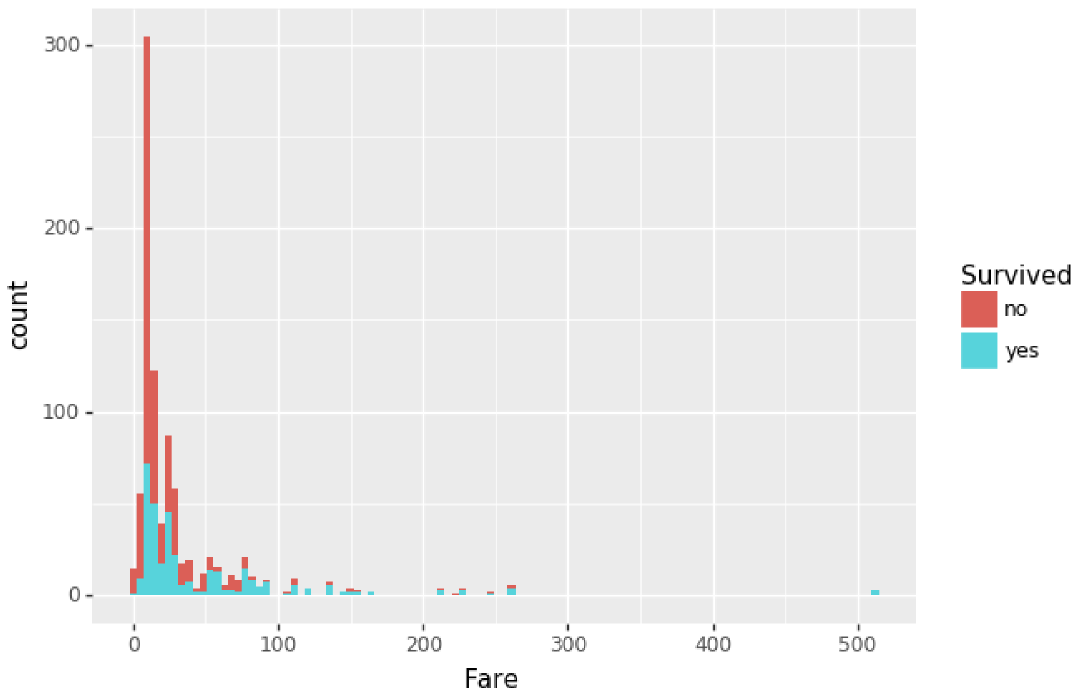
[8]: <ggplot: (105036747367)>

[9]:
```
(ggplot(df, aes(x='Survived', fill='Sex')) +
        geom_histogram()
)
```



[9]: <ggplot: (105036837012)>

[10]:
```
(ggplot(df, aes(x='Fare', fill='Survived')) +
        geom_histogram()
)
```



[10]: <ggplot: (105036872406)>

Step 4: Think about some questions that might help you predict who will survive:

1. **What do the variables look like? For example, are they numerical or categorical data. If they are numerical, what are their distribution; if they are categorical, how many are they in different categories?**
   There is a mix of categorical (Survived, Pclass, Sex, Embarked) and numerical (Fare, Age, SibSp, Parch). Of the numerical variables, Age is normally distributed although somewhat right-skewed. The other numerical variables are heavily skewed with long right tails, tapering off very quickly.

2. **Are the numerical variables correlated?**
   Running an ordinary linear model, there does not appear to be justification for correlation (R squared is close to 0, indicating neither positive or negative correlation). Further, the meaning of the variables also do not explain away any justification for correlation.

3. **Are the distributions of numerical variables the same or different among survived and not survived? Is the survival rate different for different values? For example, were people more likely to survive if they were younger?**
   I plotted Age against Survival above, and there does appear to be a slightly younger group who did survive (and might be more pronounced if the data poinst above say, age 60, were removed).

4. **Are there different survival rates in different categories? For example, did more women survived than man?**

Yes, as shown in the bar graph above, more women did survive. It's also evident that those who paid the lowest fares did not... "fare" well....

Step 5: what type of variables are in the table

[11]:
```
print("Describe Data")
print(data.describe())
print("Summarized Data")
print(data.describe(include=['O']))
```

```
Describe Data
       PassengerId    Survived      Pclass         Age       SibSp  \

```

Step 6: import visualization packages *(As a rule, I put all my imports in cell 1...)*

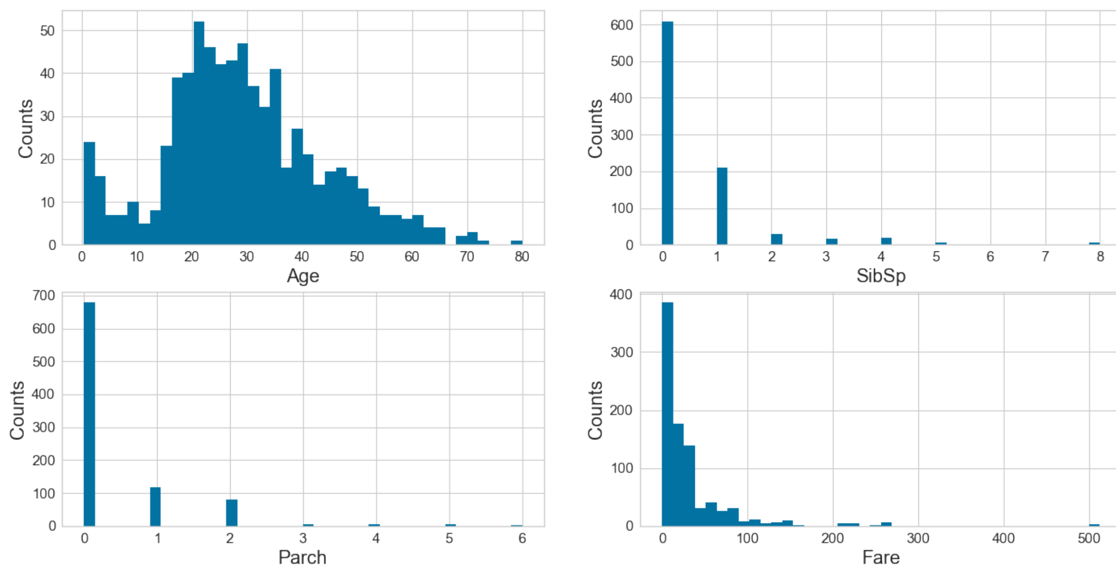
[12]:
```
# set up the figure size
plt.rcParams['figure.figsize'] = (20, 10)

# make subplots
fig, axes = plt.subplots(nrows = 2, ncols = 2)

# Specify the features of interest
num_features = ['Age', 'SibSp', 'Parch', 'Fare']
xaxes = num_features
```

```
yaxes = ['Counts', 'Counts', 'Counts', 'Counts']

# draw histograms
axes = axes.ravel()
for idx, ax in enumerate(axes):
    ax.hist(data[num_features[idx]].dropna(), bins=40)
    ax.set_xlabel(xaxes[idx], fontsize=20)
    ax.set_ylabel(yaxes[idx], fontsize=20)
    ax.tick_params(axis='both', labelsize=15)
plt.show()
```



7: Barcharts: set up the figure size

[13]:
```
plt.rcParams['figure.figsize'] = (20, 10)

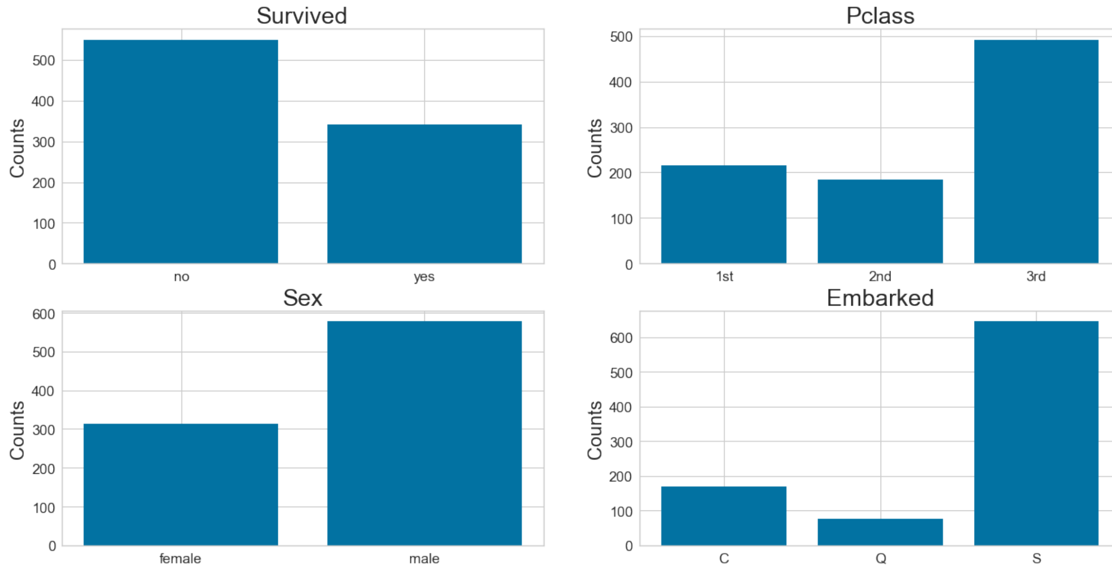
# make subplots
fig, axes = plt.subplots(nrows = 2, ncols = 2)

# make the data read to feed into the visualizer
X_Survived = data.replace({'Survived': {1: 'yes', 0: 'no'}}).
 ↪groupby('Survived').size().reset_index(name='Counts')['Survived']
Y_Survived = data.replace({'Survived': {1: 'yes', 0: 'no'}}).
 ↪groupby('Survived').size().reset_index(name='Counts')['Counts']
# make the bar plot
axes[0, 0].bar(X_Survived, Y_Survived)
axes[0, 0].set_title('Survived', fontsize=25)
axes[0, 0].set_ylabel('Counts', fontsize=20)
axes[0, 0].tick_params(axis='both', labelsize=15)
```

```python
# make the data read to feed into the visualizer
X_Pclass = data.replace({'Pclass': {1: '1st', 2: '2nd', 3: '3rd'}}).
↪groupby('Pclass').size().reset_index(name='Counts')['Pclass']
Y_Pclass = data.replace({'Pclass': {1: '1st', 2: '2nd', 3: '3rd'}}).
↪groupby('Pclass').size().reset_index(name='Counts')['Counts']
# make the bar plot
axes[0, 1].bar(X_Pclass, Y_Pclass)
axes[0, 1].set_title('Pclass', fontsize=25)
axes[0, 1].set_ylabel('Counts', fontsize=20)
axes[0, 1].tick_params(axis='both', labelsize=15)

# make the data read to feed into the visualizer
X_Sex = data.groupby('Sex').size().reset_index(name='Counts')['Sex']
Y_Sex = data.groupby('Sex').size().reset_index(name='Counts')['Counts']
# make the bar plot
axes[1, 0].bar(X_Sex, Y_Sex)
axes[1, 0].set_title('Sex', fontsize=25)
axes[1, 0].set_ylabel('Counts', fontsize=20)
axes[1, 0].tick_params(axis='both', labelsize=15)

# make the data read to feed into the visualizer
X_Embarked = data.groupby('Embarked').size().
↪reset_index(name='Counts')['Embarked']
Y_Embarked = data.groupby('Embarked').size().
↪reset_index(name='Counts')['Counts']
# make the bar plot
axes[1, 1].bar(X_Embarked, Y_Embarked)
axes[1, 1].set_title('Embarked', fontsize=25)
axes[1, 1].set_ylabel('Counts', fontsize=20)
axes[1, 1].tick_params(axis='both', labelsize=15)
plt.show()
```

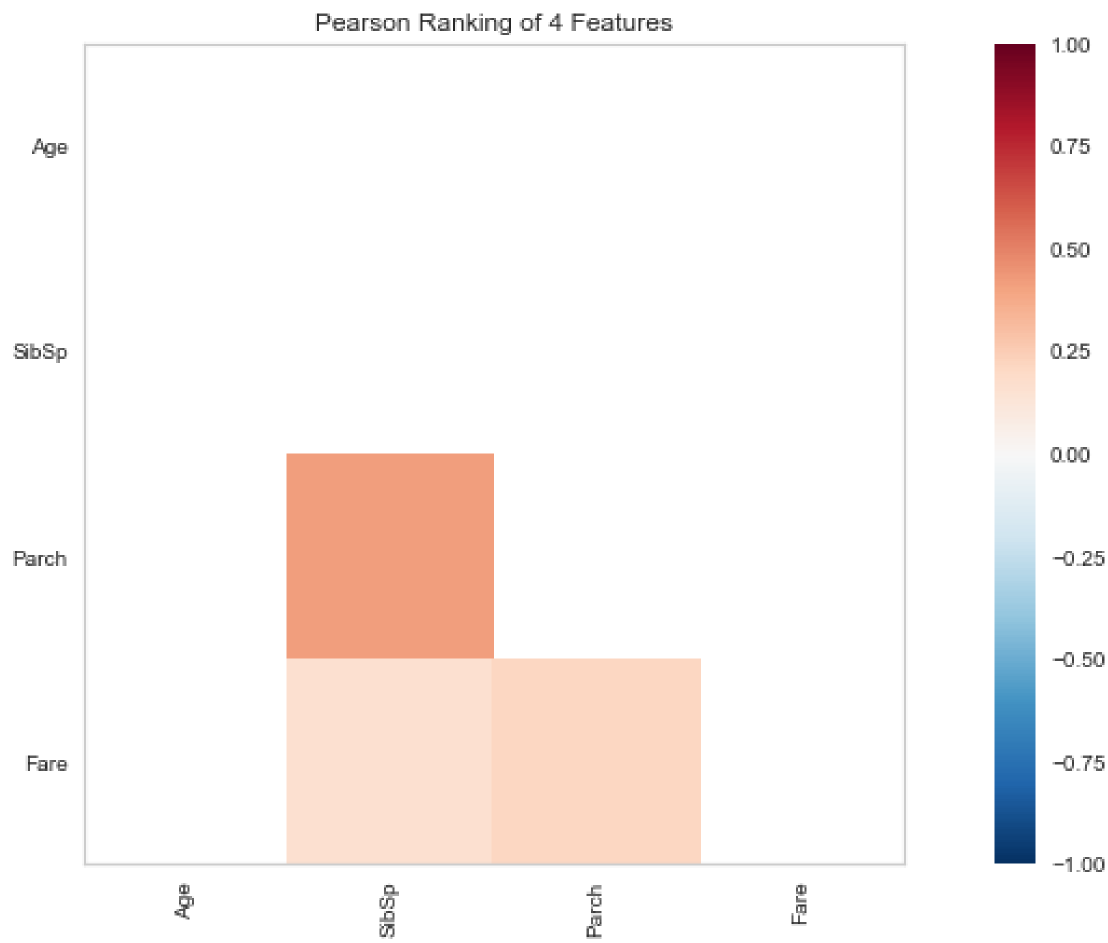


Step 8: Pearson Ranking

[14]:
```
#set up the figure size
plt.rcParams['figure.figsize'] = (15, 7)

# extract the numpy arrays from the data frame
X = data[num_features].as_matrix()

# instantiate the visualizer with the Covariance ranking algorithm
visualizer = Rank2D(features=num_features, algorithm='pearson')
visualizer.fit(X)                # Fit the data to the visualizer
visualizer.transform(X)             # Transform the data
visualizer.poof(outpath="pcoords1.png") # Draw/show/poof the data
plt.show()
```



Step 9: Compare variables against Survived and Not Survived

[15]:
```
#set up the figure size
plt.rcParams['figure.figsize'] = (15, 7)
plt.rcParams['font.size'] = 50

# setup the color for yellowbrick visualizer
set_palette('sns_bright')

# Specify the features of interest and the classes of the target
classes = ['Not-survived', 'Survived']
num_features = ['Age', 'SibSp', 'Parch', 'Fare']

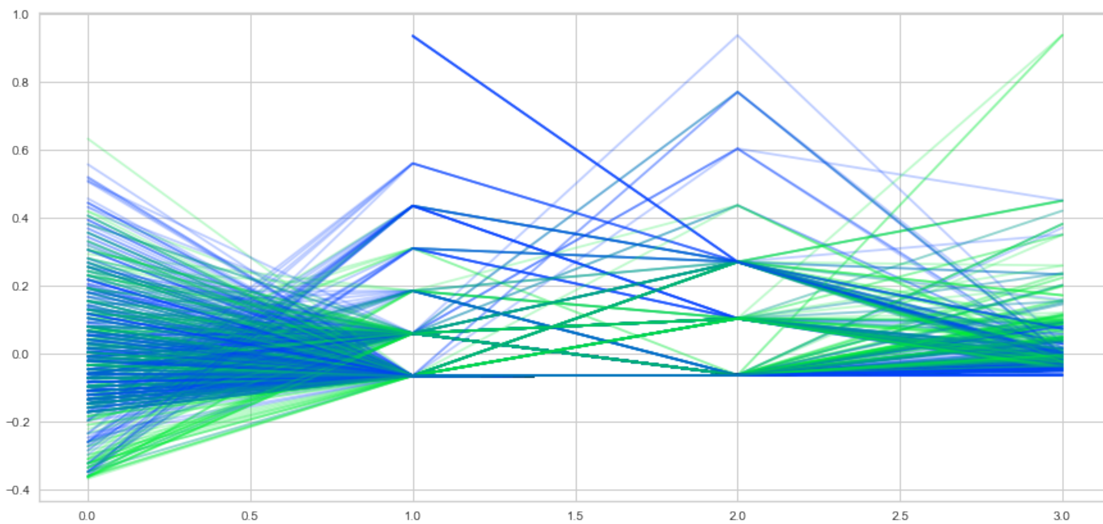
# copy data to a new dataframe
data_norm = data.copy()
# normalize data to 0-1 range
for feature in num_features:
```

```
    data_norm[feature] = (data[feature] - data[feature].mean(skipna=True)) /␣
 ↪(data[feature].max(skipna=True) - data[feature].min(skipna=True))

# Extract the numpy arrays from the data frame
X = data_norm[num_features].as_matrix()
y = data.Survived.as_matrix()

# Instantiate the visualizer
visualizer = ParallelCoordinates(classes=classes, features=num_features)

visualizer.fit(X, y)      # Fit the data to the visualizer
visualizer.transform(X)   # Transform the data
#visualizer.poof(outpath="d://pcoords2.png") # Draw/show/poof the data
plt.show()
```



Step 10 - stacked bar charts to compare survived/not survived

[16]:
```
#set up the figure size
plt.rcParams['figure.figsize'] = (20, 10)

# make subplots
fig, axes = plt.subplots(nrows = 2, ncols = 2)

# make the data read to feed into the visualizer
Sex_survived = data.replace({'Survived': {1: 'Survived', 0:␣
 ↪'Not-survived'}})[data['Survived']==1]['Sex'].value_counts()
Sex_not_survived = data.replace({'Survived': {1: 'Survived', 0:␣
 ↪'Not-survived'}})[data['Survived']==0]['Sex'].value_counts()
Sex_not_survived = Sex_not_survived.reindex(index = Sex_survived.index)
```

```python
# make the bar plot
p1 = axes[0, 0].bar(Sex_survived.index, Sex_survived.values)
p2 = axes[0, 0].bar(Sex_not_survived.index, Sex_not_survived.values,␣
 ↪bottom=Sex_survived.values)
axes[0, 0].set_title('Sex', fontsize=25)
axes[0, 0].set_ylabel('Counts', fontsize=20)
axes[0, 0].tick_params(axis='both', labelsize=15)
axes[0, 0].legend((p1[0], p2[0]), ('Survived', 'Not-survived'), fontsize = 15)

# make the data read to feed into the visualizer
Pclass_survived = data.replace({'Survived': {1: 'Survived', 0:␣
 ↪'Not-survived'}}).replace({'Pclass': {1: '1st', 2: '2nd', 3:␣
 ↪'3rd'}})[data['Survived']==1]['Pclass'].value_counts()
Pclass_not_survived = data.replace({'Survived': {1: 'Survived', 0:␣
 ↪'Not-survived'}}).replace({'Pclass': {1: '1st', 2: '2nd', 3:␣
 ↪'3rd'}})[data['Survived']==0]['Pclass'].value_counts()
Pclass_not_survived = Pclass_not_survived.reindex(index = Pclass_survived.index)
# make the bar plot
p3 = axes[0, 1].bar(Pclass_survived.index, Pclass_survived.values)
p4 = axes[0, 1].bar(Pclass_not_survived.index, Pclass_not_survived.values,␣
 ↪bottom=Pclass_survived.values)
axes[0, 1].set_title('Pclass', fontsize=25)
axes[0, 1].set_ylabel('Counts', fontsize=20)
axes[0, 1].tick_params(axis='both', labelsize=15)
axes[0, 1].legend((p3[0], p4[0]), ('Survived', 'Not-survived'), fontsize = 15)

# make the data read to feed into the visualizer
Embarked_survived = data.replace({'Survived': {1: 'Survived', 0:␣
 ↪'Not-survived'}})[data['Survived']==1]['Embarked'].value_counts()
Embarked_not_survived = data.replace({'Survived': {1: 'Survived', 0:␣
 ↪'Not-survived'}})[data['Survived']==0]['Embarked'].value_counts()
Embarked_not_survived = Embarked_not_survived.reindex(index = Embarked_survived.
 ↪index)
# make the bar plot
p5 = axes[1, 0].bar(Embarked_survived.index, Embarked_survived.values)
p6 = axes[1, 0].bar(Embarked_not_survived.index, Embarked_not_survived.values,␣
 ↪bottom=Embarked_survived.values)
axes[1, 0].set_title('Embarked', fontsize=25)
axes[1, 0].set_ylabel('Counts', fontsize=20)
axes[1, 0].tick_params(axis='both', labelsize=15)
axes[1, 0].legend((p5[0], p6[0]), ('Survived', 'Not-survived'), fontsize = 15)
plt.show()
```
